

# Finite-range survival and threshold sensitivity

## Fixed illustration: realization 0, order 100; all cells retained in tables

No observed  $\Delta\text{NLL} > 0.01$  nat  
No tail fitted

Curves are fitted conditional excess models  $\times$  observed exceedance probability. Invalid/sparse fits omitted explicitly; zero survival is not floored.  
Curves do not identify an asymptotic law or complexity class; see held-out-window scores and realization/order variation in the report.
